Lab 3: Component Modelling And Architectural Pattern Selection

NAME: SANAND KUMAR SHETTY SRN: PES2UG24CS438

Component Diagram Explanation

The component diagram shows the main parts of our Student Project Portfolio and Showcase App and how they communicate with each other.

1. Portfolio App

The Portfolio App is the main part of the system. It allows students to create their profile, upload their project files, and participate in voting.

Profile Manager:
It is used to create and manage the student's profile and portfolio details.

Media Uploader:
It allows students to upload project-related files such as images, videos, documents, or other files.

Voting Service:
It manages the voting process. Students can vote for projects, and the system checks whether the voter is valid before accepting the vote.

2. Repository Integration

This part is responsible for connecting the application with a code repository such as GitHub.

Git Connector:
It connects to the student's repository and checks or validates the project repository. This helps the system get the project information from the repository.

3. Platform Service

The Platform Service provides common services that are used by different parts of the application.

File Storage:
It stores the project files uploaded by students.

Identity Verification:
It checks and verifies the identity of a user, especially when the user wants to vote.

Database:
It stores important information such as student details, project details, votes, scores, and review information.

4. Evaluation Workspace

The Evaluation Workspace is used for evaluating student projects.

Scoring Engine:
It is responsible for giving scores to the projects based on the evaluation criteria. The score is then stored in the database.

Review Flag Handler:
If a reviewer finds something that needs additional attention, they can flag the review. This component handles those flagged reviews.

The system works like this:

Student → Create Profile → Upload Project → Connect Repository → Store Project → Other Students Vote → Verify Voter → Faculty Evaluates Project → Score Stored in Database
